# Inventory Counting

## Web & Mobile App

Transparency, security, and a precise planning foundation: With the **Inventory Counting** app, the tedious inventory process will no longer be a hassle.

## Your Benefits

- **Streamlined Processes:** With the desktop app, you can create inventory orders and effortlessly conduct the inventory count using the mobile app. This turns the inventory process into child's play.
- **Effective Planning:** No more stress as the balance sheet date approaches. With the desktop app, you establish a valid foundation for future inventories in advance.
- **Reduced Error Sources:** Avoid errors arising from manually transcribing count lists. The mobile app ensures counts are directly transferred into the system.
- **Fewer Inventory Discrepancies:** Utilize the integrated Bitergo WMS solution to ensure changes appear immediately in your Warehouse Management System. Benefit from seamless integration with other apps such as **Incoming Goods, Outgoing Goods, Storage, or Corrections.**

# Inventory Counting Web & Mobile App

## Functions and Features

### The following types of inventory are supported by the app:

- Location-based Inventory (standard) with the option to limit counting areas (e.g., for a specific warehouse section).
- Location-based Inventory with Empty Location Counting, allowing simultaneous verification of empty locations. This enables setting the date of the last count.
- Item-based Inventory, where the stock for a single item is checked per count list. However, in this case, the date of the last count is set on the item master data.

### Initiating Inventory Counts

- The system automatically assigns unique inventory numbers. To facilitate identification, you can also add a description or a note.
- Select a counting method (Location-based Inventory with/without Empty Location Counting; Item-based Inventory).
- If multiple clients are managed in the system, you can manually select them when creating the inventory order.
- Determine what should be counted: Create count lists and set any necessary locks.

# Inventory Counting Web & Mobile App

## Functions and Features

### Conducting Inventory Counts

Effortless recording via handheld device and the mobile app:

- Upon launching the mobile app, you'll see all authorized inventory counts.
- The locations and the handling unit containing the items to be counted (along with the item number) will be displayed.
- For Location-based Inventory with empty locations, the user must specify if a location reported as empty in the system is indeed devoid of goods.
- For Item-based counting, if available in the system, an image of the respective item will be displayed.

In addition to or in place of the mobile app, a traditional inventory using pen and paper is also possible: Print clear count lists and transfer the results into the system after counting.

### Confirming Inventory Results and Completing the Inventory

Upon completion of each inventory, you will receive a clear overview of:

- Start and end dates of the inventory
- All counts
- Quantity discrepancies per item as an overview

### Inventory Report

- Overview of inventory data (e.g., count lists, dates, locations, status, quantities, discrepancies)
- Excel export option available.
